JET CLUB · DAY 1

Cheatsheet

Tools: tools.sadiqsalau.com
Class files: github.com/sadiqsalau/jet-club

Words to know

Program: a list of instructions that a computer follows, step by step. Like a recipe.

Code: the text you write in a programming language.

Variable: a named box that remembers a value, like `name`.

Web page: a file, written in HTML, that a browser shows.

Browser: the app that opens web pages: Chrome, Safari or Edge.

Repository: a project folder for your code on GitHub.

GitHub Pages: turns a repository into a website, for free.

Programming language: a way of writing instructions that both people and computers can understand.

Bug: a mistake in code. Finding and fixing it is called **debugging**.

Tag: an HTML label in angle brackets, like `<h1>`. Most come in pairs.

Website: one or more pages at an address.

Account: your own profile on GitHub, with a username.

Commit: saving a change, with a short note about it.

Python basics

```
name = input("What is your name? ")
age = int(input("How old are you? "))

print("Hello, " + name + "!")
print("In 10 years, you will be", age + 10)

if age >= 13:
    print("You're old enough to join JET Club!")
```

`input("...")`	Asks a question and listens
`print("...")`	Shows text on the screen
`name = ...`	Puts a value in a variable
`int(...)`	Turns text like "14" into the number 14
`if ...:`	Runs the indented lines only when it's true
`= and ==`	= stores a value; == asks "are these the same?"
`+`	Adds numbers, or joins pieces of text

Run it: press **F5** in Thonny, or **Run** on Coding Python. **Common bugs:** a missing quote `"`, a missing colon `:` after `if`, or wrong spaces at the start of a line.

JET CLUB · DAY 1

Your web page

Change → Save → Refresh the browser

HTML: the skeleton

```
<h1>Hello, I'm Amina</h1>
<p>I'm learning to code at JET Club.</p>
<ul>
  <li>My favourite food: jollof rice</li>
  <li>My favourite subject: maths</li>
</ul>
```

`<h1>...</h1>`	A big heading
`<p>...</p>`	A paragraph
`<ul>...</ul>`	A list
`<li>...</li>`	One item in a list
`<!-- ... -->`	A note that doesn't show on the page

Tags come in pairs: an opening tag, and a closing tag with a slash `/`.

CSS: the clothes

Change your colours at the top of `my-page/index.html`:

```
--main-color: tomato;
--background: #0f172a;
```

Try colour names like tomato, gold or teal, or codes like #8b5cf6.

JavaScript: the brain

Change the fun facts near the bottom, then click the button:

```
"I can solve a Rubik's cube.",
```

Each fact goes in quotes, with a comma after it.

Put your page online with GitHub Pages

1. Sign up at **github.com**, then enter the code GitHub emails you.
2. Top right: **+** › **New repository**. Name it exactly `username.github.io`, with your username in lowercase. Keep it **Public**.
3. **Add file › Upload files**: your `index.html` from the my-page folder, and your photo if you added one. Press **Commit changes**.
4. **Settings › Pages**: publish from the **main** branch.
5. Wait a few minutes (up to 10), then open **https://username.github.io**

To change it later: edit `index.html`, then upload it again. **On a tablet?** Edit in W3Schools Tryit, then use **Add file › Create new file** on GitHub.

Your page is public

- First name only
- Nothing about where you live
- A photo only if your parents are OK with it

Keep learning (free)

- **freeCodeCamp:** freecodecamp.org
- **W3Schools:** w3schools.com
- The quiz and guessing games in your day-1 folder
